PROGRAMING RULES

- Do not *echo* on a controller
- Every route must be associated with a controller
- Every view must extend from *master.blade.php*
- It is not allowed to open and close *php* within views
- In each controller, it is necessary to specify its domain, for this you must put the namespace *App\Http\Controllers*
- In each save method there must be a section for the validation of the form fields that invokes said function.
- In the views it is necessary to use the *Blade Templates*
- When the existence of an Object type object is validated, it is necessary to implement a *try - catch* to prevent existence errors from affecting the operation of the application. That is, if the object does not exist, it is directed to index view.
- Routes must have a name associated with them to have scalability.
- The **Laravel Migrations** system should be used to keep track of the database. Every change to database has to be in a different file of migration to have a record.
- Within the views, the html tags cannot contain the *Style = "..."* attribute for the styles you must add styles in customStyle.css
- The views must be of type *.blade.php* and not of type *.hmtl* or *.php*
- Do no execute queries in Blade templates
- Use config and language files, constants instead of text in the code
- Never put any logic in routes files
- Models must *extend* from *Model*
- Controllers must *extend* from *Controller*
